

### ABSTRACT

There is provided a visual indicator for infection having a substrate and an amine sensitive dye. The dye covers an area of the substrate. The dye covered  
5 substrate may be placed in a personal care product, a health and hygiene product, a disposable test or a non-disposable test. The dye changes color in the presence of amines which are characteristic of infection thus alerting the user to the possibility of infection. Such a test may be useful in the diagnosis of vaginitis, of infected wounds and of grain or other materials infected with amine generating microbes.
